This course introduces Agentic AI Design Patterns – reusable templates that guide how intelligent agents perceive, reason, act, and adapt. These patterns offer a structured approach to designing agent behaviors such as reflection, tool use, and collaboration, enabling explainable agentic systems. The course covers the anatomy of a pattern – triggers, flows, roles, and feedback – and explores key strategies like ReAct, reflex vs. deliberative agents, and reasoning through chain-of-thought and tree-of-thought. You'll learn multi-agent collaboration roles, dynamic task routing, and feedback-driven adaptation. Finally, you'll explore reflective patterns where agents revise their own reasoning to improve output. By the end, you'll be equipped to apply these patterns across frameworks and domains for advanced, adaptive, and collaborative agentic AI design.

The amount of time available to you is constant – you can't buy more and you can't save it for later. However, by managing your time, you can increase your productivity. And the better you understand your own personal productivity, the easier it will be to manage your time effectively. In this course, you'll learn about how you can use task management to maximize your productivity. You'll discover the benefits of using time management and assessing the value of your tasks. You'll learn about benefits of setting goals and how productivity is tied to your ability to assess time and set priorities. And you'll also learn about the process of "chunking" your time and how to use different types of to-do lists effectively.

Skillsoft issued completion badges are earned based on viewing the percentage required or receiving a passing score when assessment is required. Fine-tuning models is a critical aspect of leveraging pre-trained artificial intelligence models to suit specific tasks or domains. OpenAI allows developers to fine-tune models like GPT-3 and 4, enabling customization for particular applications. You will begin this course by creating prompt-completion pairs for fine-tuning, running a fine-tuning job, and observing the model's performance. You will send prompts based on the training data and examine the model's attempt to answer questions. Next, you will dive into connecting with the Assistants API programmatically. You will create an assistant by providing a role description and model, and you will initiate a thread to simulate user-assistant conversations. You will also upload files and query the assistant based on information contained in the files. Finally, you will explore creating and comparing text embeddings, efficient numerical representations of text that capture meaning and semantics of the text. You will learn how embeddings of similar words are numerically close to one another and how embeddings can be used as a preprocessing technique to represent text for other machine learning applications such as clustering and classification.

Skillsoft issued completion badges are earned based on viewing the percentage required or receiving a passing score when assessment is required. Generative artificial intelligence (GenAI) can create new content, such as text, images, and music. It is powered by machine learning (ML) models that have been trained on massive datasets of existing content. Prompt engineering is the process of designing and crafting prompts that guide generative AI models to produce the desired output. You will start this course by learning how you can leverage prompt engineering to improve your day-to-day and work-related tasks. Next, you will see examples of prompting in action with external generative AI chatbots such as ChatGPT, Google Bard, and Microsoft Bing Chat. As several of these tools may not be supported on many corporate devices, you will not be expected to create accounts on those platforms, but you will be able to apply the learnings and principles to any corporate conversational AI chatbot in similar ways.

Skillsoft issued completion badges are earned based on viewing the percentage required or receiving a passing score when assessment is required. Different types of prompts serve distinct purposes when interacting with language models. Each type enables tailored interactions, from seeking answers and generating code to engaging in creative storytelling or eliciting opinions. In this course, you will learn the four elements of a prompt: context, instruction, input data, and output format. Next, will also explore prompt categories, such as open-ended, close-ended, multi-part, scenario-based, and opinion-based. Finally, you will look at different types of prompts based on the output that they provide. You will use prompts that generate objective facts, abstractive and extractive summaries, classification and sentiment analysis, and answers to questions. You'll tailor prompts to perform grammar and tone checks, ideation and roleplay, and mathematical and logical reasoning.

Skillsoft issued completion badges are earned based on viewing the percentage required or receiving a passing score when assessment is required. This course introduces the foundational principles of agentic AI – AI systems that go beyond passive prediction to actively perceive, reason, act, and adapt within dynamic environments. You'll explore what makes agentic systems fundamentally different from traditional AI, break down their core properties, and follow the internal flow of an agent as it interacts with its environment. Real-world examples and critical limitations are also examined to ground your understanding in practical, high-impact contexts. This course sets the stage for deeper architectural and implementation-focused learning in the rest of this series.
